

AM-13.01 — ISRU: use local resources instead of bringing everything from Earth

Guiding question

□ MEASURED · □ CONVENTION · □ CALCULATED · □ LEARNING ASSUMPTION · □ MISSION DATA · △ APPROXIMATION

Course map

The real phenomenon → Vocabulary and problem boundary → Course-specific system view → Mathematical relationship and reading the symbols → Worked calculations and interpretation

1 — The real phenomenon

ISRU means In-Situ Resource Utilization : use resources at the destination instead of bringing every kilogram of water, oxygen, material or propellant feedstock from Earth.

The guiding question is: How can a local resource become water, oxygen, material or another product that is actually usable? Reasoning starts with the physical or operational function before introducing the mathematical relationship. The goal is not to accumulate terminology, but to know which quantity changes, why it changes and what becomes hazardous when it leaves its domain. For “AM-13.01 — ISRU: use local resources instead of bringing everything from Earth”, the first task here is therefore to identify the mechanism specific to this subject before searching for an equation or reference value.

2 — Vocabulary and problem boundary

In “ISRU: use local resources instead of bringing everything from Earth”, distinguish the phenomenon, available measurement, any command, the margin and the success criterion. The calculation boundary states what is included and excluded; without that boundary, a percentage, mass or time may be mathematically correct but wrong as an engineering conclusion. For “AM-13.01 — ISRU: use local resources instead of bringing everything from Earth”, the chosen boundary also states what would otherwise be double-counted or omitted from a mission budget.

extraction rate, purity, specific energy, machine availability, wear, intermediate stocks and conversion yield
lower resource grade than expected, unavailable excavator, clogged filter or out-of-spec product
long campaigns on simulants, matter-energy balances, repeated maintenance and product quality control

Equation - evidence - decision

relation propre au cours

Failure to test: The reference failure is not a vague “broken component.” For “ISRU: use local resources instead of bringing everything from Earth”, test in particular lower resource grade than expected, unavailable excavator, clogged filter or out-of-spec product. Diagnosis asks which symptoms appear first, which are only consequences and which action preserves the most options.

AM-13.01 — ISRU: use local resources instead of bringing everything from Earth**3 — Course-specific system view**

This lesson does not reuse one generic picture for every subject. The system view follows cause → measured quantity → decision or physical response → limit for “ISRU: use local resources instead of bringing everything from Earth”. The English text remains fully equivalent while large translated illustrations are intentionally deferred until their dedicated artwork is supplied. For “AM-13.01 — ISRU: use local resources instead of bringing everything from Earth”, the system view must expose inputs, outputs, measured quantity and the consequence of drift without relying on a generic module diagram.

4 — Mathematical relationship and reading the symbols

Before substituting numbers, write the unit of every term, state whether the relationship is a physical law, approximation or project indicator, and check dimensional consistency. This is especially important here because “ISRU: use local resources instead of bringing everything from Earth” combines quantities that do not all have the same evidence status. For “AM-13.01 — ISRU: use local resources instead of bringing everything from Earth”, this relationship is chosen because of the phenomenon under study; a different dominant quantity would require a different equation or model.

5 — Worked calculations and interpretation

1. Exemple relation numérique du cours Interpretation: this result is used only after comparison with units, margin and the scenario boundary for “ISRU: use local resources instead of bringing everything from Earth”.

6 — What the formula does not contain

The relationship “relation propre au cours” does not by itself contain all of “ISRU: use local resources instead of bringing everything from Earth”. It does not automatically tell us whether a sensor is valid, a structure is aging, a resource is accessible, a command arrives in time or a secondary failure removes margin. The example relation numérique du cours therefore remains a local calculation rather than a complete architecture.

To make the model useful, explicitly add the quantities that dominate this subject: extraction rate, purity, specific energy, machine availability, wear, intermediate stocks and conversion yield. We can then ask which variation truly changes the result, which is negligible and which forces an architectural change. For “AM-13.01 — ISRU: use local resources instead of bringing everything from Earth”, this model limitation states exactly what a correct calculation still cannot establish about the real system.

Operational table

Phenomena / sections:	3 — Course-specific system view ; 4 — Mathematical relationship and reading the symbols ; 5 — Worked calculations and interpretation
Relationship to revisit:	relation propre au cours
Expected decision:	measure → compare with margin → choose nominal, degraded or stop

Check before continuing

Explain without rereading: 3 — Course-specific system view ; 4 — Mathematical relationship and reading the symbols ; 5 — Worked calculations and interpretation. State one measured quantity, one margin and one possible decision.

AM-13.01 — ISRU: use local resources instead of bringing everything from Earth**7 — Instrumentation, observability and data quality**

For “ISRU: use local resources instead of bringing everything from Earth”, observability relies on extraction rate, purity, specific energy, machine availability, wear, intermediate stocks and conversion yield. Each datum has a unit, acquisition rate, uncertainty, timestamp and validity domain. A value arriving without context can be more dangerous than no measurement because it creates unjustified confidence.

Consistency is checked with at least one independent piece of information when the function is critical. A trend, physical balance or second measurement principle helps distinguish a real system change from a drifting sensor. For “AM-13.01 — ISRU: use local resources instead of bringing everything from Earth”, the selected instrumentation must distinguish a real physical change from sensor drift or a bad state estimate.

8 — Phenomenon-specific failures and recovery

The reference failure is not a vague “broken component.” For “ISRU: use local resources instead of bringing everything from Earth”, test in particular lower resource grade than expected, unavailable excavator, clogged filter or out-of-spec product. Diagnosis asks which symptoms appear first, which are only consequences and which action preserves the most options.

The degraded mode must be defined before failure: minimum function, allowable duration, consumed stock, crew action, abort condition and return-to-nominal criterion. That sequence is topic-specific and cannot be replaced by one universal paragraph about redundancy. For “AM-13.01 — ISRU: use local resources instead of bringing everything from Earth”, the degraded mode is defined around the minimum function specific to this subject, with an abort threshold and a return-to-nominal condition.

9 — NASA / reference case

The operational case is treated as a production or service chain: input resource, machine, intermediate storage, quality control, maintenance and final user. NASA ISRU, autonomy and manufacturing work helps separate a technology demonstration from a truly available Mars industrial capability.

The case is used only within what it actually demonstrates. Flight measurement, human-system standard, component test and architecture study are different kinds of evidence; the text therefore states what is observed, calculated, simulated or still prospective. For “AM-13.01 — ISRU: use local resources instead of bringing everything from Earth”, the cited NASA case is used as targeted evidence for this phenomenon and is never turned into one universal Mars architecture.

Operational table

Phenomena / sections:	7 — Instrumentation, observability and data quality ; 8 — Phenomenon-specific failures and recovery ; 9 — NASA / reference case
Relationship to revisit:	relation propre au cours
Expected decision:	measure → compare with margin → choose nominal, degraded or stop

Explain without rereading: 7 — Instrumentation, observability and data quality ; 8 — Phenomenon-specific failures and recovery ; 9 — NASA / reference case. State one measured quantity, one margin and one possible decision.

AM-13.01 — ISRU: use local resources instead of bringing everything from Earth

10 — Architecture trade

A good solution for “ISRU: use local resources instead of bringing everything from Earth” does not maximize one metric. Compare nominal performance, mass, energy, simplicity, maintenance, crew time, common dependencies and recoverability. An option that improves relation numérique du cours can still be rejected if it makes failure detection or repair much harder.

The trade is recorded together with its assumptions. If environment data, mass or mission cadence changes, we know which conclusions must be recomputed instead of silently preserving an obsolete choice. For “AM-13.01 — ISRU: use local resources instead of bringing everything from Earth”, the trade is evaluated against the interfaces actually touched by this subject rather than a generic list of desirable qualities.

11 — Demonstration, testing and success criteria

The evidence strategy for “ISRU: use local resources instead of bringing everything from Earth” combines long campaigns on simulants, matter-energy balances, repeated maintenance and product quality control. Every test records exact hardware, software, configuration, environment, tolerances and success criterion. A successful demonstration outside the mission domain does not replace qualification inside it.

Evidence grows by levels: analytical relationship, simulation, component, subsystem, integrated system, duration and failure. This hierarchy prevents one spectacular test from being presented as validation of the whole mission. For “AM-13.01 — ISRU: use local resources instead of bringing everything from Earth”, demonstration must reproduce the constraints that make this phenomenon difficult; a spectacular test outside the mission domain is insufficient.

12 — Decision exercise

Situation: revisit “ISRU: use local resources instead of bringing everything from Earth” with a 20% increase in the most penalizing quantity from the first worked example while one measurement or backup path is unavailable.

Situation: revisit “ISRU: use local resources instead of bringing everything from Earth” with a 20% increase in the most penalizing quantity from the first worked example while one measurement or backup path is unavailable. Expected answer: recompute the relationship, identify remaining margin, check whether observability is still adequate, and decide whether degraded operation remains acceptable. Multiplying by 1.2 is not enough if the variation also changes interfaces or limits.

Operational table

Phenomena / sections:	10 — Architecture trade ; 11 — Demonstration, testing and success criteria ; 12 — Decision exercise
Relationship to revisit:	relation propre au cours
Expected decision:	measure → compare with margin → choose nominal, degraded or stop

Check before continuing

Explain without rereading: 10 — Architecture trade ; 11 — Demonstration, testing and success criteria ; 12 — Decision exercise. State one measured quantity, one margin and one possible decision.
